3.2.2 Government-Furnished Property (GFP). One 16 PIP and Suspension Module, Part Number 2018639, is a GFP component of the assembly.

3.2.3 Standards of Manufacturing, Manufacturing Process, and Production

3.2.3.1 Critical Processes. Critical processes and adjustments shall be performed in the sequence established by Figure 2.

3.2.3.1.1 Compensation for Null Coincidence

3.2.3.1.1.1 TG Capacitance. The proper values of C3 and C4 for the compensation of the TG Windings shall be determined in accordance with the following requirements:

a. To properly compensate the DC Amplifier output, the values of C3 and C4 shall be alternately replaced until the compensated output approximates that of Figure 3.

b. Stable 3:3-4:4 or 2:2-3:3 nulls shall be obtained with the PRA vertically up.

d. The PIPA bias (A_b) and the down angle (A_D) shall be determined from the two null angles.

e. The PIPA bias shall be less than 330 arc sec. If the calculated null bias is greater than ±330 arc sec, bias resistors R5 and R6 shall be replaced until the PIPA bias is less than ±330 arc sec.

f. Bias potentiometer R-7 shall be adjusted to the required acceleration bias.

3.2.3.1.3 Scale Factor. The assembly scale factor shall be determined in accordance with the following requirements:

a. The scale factor potentiometer (R10) shall be set at the center position.

b. The PIPA IA shall be postioned at A_D -90° (+1g) and the total number of clock pulses shall be determined for 250,000 "P" pulses.

c. The PIP IA shall be positioned at A_D+90° (-1g), and the total number of clock pulses shall be determined for 250,000 "P" pulses.

d. From the counts obtained at the ±1g orientation of the PIP input axis the scale factor shall be determined, using the formulas shown in Para. 6.4.

e. The PIPA scale factor shall be 5.85 cm/sec/pulse ±400 ppm. New values of scale factor resistors R11 and R12 shall be selected until this scale factor is obtained.

3.2.3.1.4 PIP Axis Alignments

3.2.3.1.4.1 IRA About ORA

a. The assembly shall be operating in a closed loop mode.

b. The bias angle (A_b) and the down angle (A_D) shall be calculated after obtaining a stable PRA down null, PRA up null, and an additional PRA down null which shall repeat within 5 arc sec of the first PRA down null.

c. Position the dividing head to the angle ($A_{VERT-REF} + A_b$).

d. Use a torque wrench to loosen the outer alignment screws.

e. Insert the rotary adjustment tool in the top flange notches of the PIP case.

f. Use the lever arm of the rotary adjustment tool to rotate the PIP until the SG closed loop pattern is approximately at null.

g. Tighten the outer alignment screws to 3 in-lb.

4.2.3.8 Bias Adjustment. Bias adjustment shall be adjusted in accordance with the method specified in 3.2.3.1.2 and shall meet the requirements of 3.1.2.4.

4.2.3.9 Scale Factor and Bias. Scale factor and bias shall be measured to determine that the requirements of 3.1.2.4 and 3.1.2.5 have been met. To assure that the correct PIPA bias is measured the bias angle (A_b) and the down angle (A_D) shall be calculated after obtaining a stable PRA down null, PRA up null, and an additional PRA down null which shall repeat within 5 arc sec of the first PRA down null.

4.2.3.10 Stability. The stability shall be determined in accordance with the following requirements for a 4-hour run:

a. From PRA up and PRA down null angles calculate the bias angle (A_b) and the down angle (A_D). Set the bias to be less than 0.05 cm/sec^2 by adjustment of R7. At least two sets of nulls which are coincident within 5 arc seconds must be obtained.

b. Determine the PIPA scale factor from the ratio of "P" pulses to clock pulses in the IA up and IA down orientations. The duration of the count shall be 500,000 "P" pulses. Adjust R10 (Reference Drawing 2007105) to set the scale factor to within ±50 ppm of the nominal value.

c. Check the bias to insure that it is still within specification limits following scale factor adjustment.

d. Record the dynamic PVR, SF, and I_{TM} voltages in the IA up position.

e. With the IA up, monitor the PIPA output and the I_{TM} voltage for at least 4 hours.

f. Terminate the stability run, in the following sequence:

   (1) Measure the dynamic PVR, SF and I_{TM} voltages in the IA up position. Record.
   (2) Obtain IA down counts for SF calculation.
   (3) Obtain nulls for bias determination.

g. Calculate and record the initial and final values and deviations in PVR and SF voltages, SF current, SF, and bias.

4.2.3.11 Bonding of Alignment Screws. Bonding of alignment screws shall be accomplished with bonding agent, Drawing 2021529. The relative position of the alignment rings shall remain unchanged during the bonding process.

4.2.3.10 Stability. The stability shall be determined in accordance with the following requirements for a 4-hour run:

a. From PRA up and PRA down null angles caclulate the bias angle (A_b) and the down angle (A_D). Set the bias to be less than 0.05 cm/sec^2 by adjustment of R7. At least two sets of nulls which are coincident within 5 arc seconds must be obtained.

b. Determine the PIP scale factor from the ratio of "P" pulses to clock pulses in the IA up and IA down orientations. The duration of the count shall be 250,000 "P" pulses. Adjust R10 (Reference Drawing 2007105) to set the scale factor to within ±50 ppm of the nominal value. Scale Factor may be computed only when the printout of the LEM Count Repeatability is within 10 counts.

4. QUALITY ASSURANCE PROVISIONS

4.1 GENERAL. The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein.

4.1.1 Test Conditions

4.1.1.1 Environmental. Unless otherwise specified, the assemblies shall be tested under the following ambient conditions:

a. Temperature: 25° ±10°C
b. Relative Humidity: 60% max
c. Barometric Pressure: 28 to 32 inches of Hg

4.1.1.2 Special Condition - PIP Degaussing. After external signals have been applied to the TG, the PIP shall be degaussed at a current-time rate defined in Figure 4. The TM+ winding shall be degaussed first, followed by the TM-winding. The degaussing shall be repeated three times. PIP degaussing shall be performed as the first procedure in the test sequence. Scale factor and bias data shall not be taken after degaussing until the PIP has been operating closed-loop for 1/2 hour.

4.1.1.3 Test Console. All tests shall be conducted on a four-bay 16 PIPA Test Console. (Reference NASA Drawing R101837) and Phase Angle Voltmeter for alternate method in measuring suspension phasing. For the acceptance tests listed in 4.2.3, all modules including the calibration module shall be located on the heatsink in the electronics drawer.

4.1.2 Nonconforming Units. Failure of the assembly to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming assembly corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant NASA representative, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.1.3 Test Sequence. The required acceptance test sequence shall be as shown in Figure 5.

4.2 TESTS AND VERIFICATIONS

4.2.1 Drawing Compliance. The assembly components shall have been visually examined for compliance to the requirements of their applicable drawings. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, connector pin misalignment, and legibility and appearance of markings which would be detrimental to system function or performance.

APPROVALS	C. METZGER NASA/MSC	MIT/IL	E. G. Powers R. Greenwood ACSP

3.1.6 Minimum Output. The output of the amplifier shall be a minimum of 30V for both 0° and π phase input signals when the following conditions exist:

a. A degraded supply voltage.
b. A 10V input signal applied to the servo input.

3.1.7 Frequency Response. When the following conditions exist, the frequency response of the amplifier shall be as specified in Table I. When an unbalance occurs at the output, the output determination shall be an average value.

a. A nominal supply voltage.

b. An 800 cps suppressed carrier input signal to the servo input which has been adjusted in amplitude at various modulation frequencies to provide an output of 10V pp.

3.1.8 Amplifier Feedthrough. The amplifier output shall be 0.2V maximum and 0.05V minimum for the following conditions:

a. Nominal Supply voltage applied
b. A 0.5V input signal to the hand controller input
c. Pin 22 disconnected from the positive supply voltage.

TABLE I

FREQUENCY RESPONSE

MODULATION FREQUENCY (cps) ±5%	INPUT SIGNAL RATIO		PHASE SHIFT * (Degrees)
	Minimum	Maximum	
0.1 (Reference)	- -	--	
0.8	0.630	0.794	
20.0	- -	--	25±10

*With respect to the modulation frequency

3.1.9 Quadrature Rejection. When the following conditions exist, the 800 cps (0° or π phase) component of the output shall be less than 12V rms when the input quadrature signal is leading the reference voltage by 90.0° ±0.5° and when it is lagging the reference voltage by 90.0° ±0.5°.

a. A nominal supply voltage.
b. A 100 mv, 800 cps quadrature input to the servo input.

3.1.10 Feedback Compensation Noise. When the following conditions exist, the output noise shall not exceed 2 mv of the 0° phase or π phase, 800 cps component, nor shall it exceed 10 mv total.

a. A nominal supply voltage.
b. Inputs to the feedback compensation shorted to signal Lo.

VII. PROCEDURE:

NOTE: The procedure for retrofiting the Computer Test Set is presented in five parts, specifically:

1. General Instructions
2. P&M Retrofit - adding 3 capacitors
3. Self Test Retrofit - adding 1 capacitor
4. Logic Drawer #2 Retrofit - wirewrap changes
5. Retest Procedures

1. General Instructions:

1.1 Read and understand the complete procedure prior to attempting the retrofit. Do not discard any parts unless so directed. No deviation should be made from an any procedure outlined herein.

1.2 Update the Post Acceptance Data Package (PADP) as progress is made through the RIB.

1.3 All workmanship shall meet standards as defined in Workmanship Standard, AC-STD-1, dated 3 March 1964.

1.4 Refer to documents listed in Paragraph VI, part 4, for applicable ND specifications.

1.5 Inspect all work performed to ensure quality in accordance with referenced documents.

1.6 Serial number stencil marked after retrofit shall be the same serial number as before retrofit.

2. Retrofit the Programmer and Monitor Drawer, part no. 2014041-041, using retrofit kit 8104215 as follows:

2.1 Remove the Computer Test Set nameplate on the front center of the cabinet by chiseling off the heads of the drive screws. Drive the remaining portion of the drive screws into the cabinet. Dispose of removed nameplate per Paragraph IX.

2.2 Release the Programmer & Monitor Drawer Assembly, part no. 2014041-041, by unscrewing knurled captive screws, and pull the drawer out to its slide-lock position.

2.3 Lift up Logic Plate Assembly No. 3 to slide-lock position and disconnect the cable connectors.

2.4 Remove the Logic Plate Assembly from the drawer by removing retaining screws (two places) and place the assembly in a clean area. Retain hardware for reassembly.

2.5 Remove the black protective cover by unscrewing cross-head screws (16 places). Retain cover and screws for reassembly.

2.6 Remove from retrofit kit three 1 uf, 35 V capacitors, part number CS13AFC10K, and assemble insulation sleeving (1006776-197), also supplied in kit, to the leads of the capacitors.

2.7 Reference drawing 2014336 and add the capacitors to the following pin locations using solder and soldering tools per ND 1002071.

Capacitor No.	Pos. Location	Neg. Location
C21	3A17-13	3A17-20
C22	3B34-10	3B31-20
C23	3A17-1	3A18-20

2.8 Reference drawing 2014336. Remove stencil "041" from part number on top of frame support using Chem-Stripper and cotton swabs.

2.9 Neutralize action of Chem-Stripper with isopropyl alcohol and cotton swabs. Clean area throughly.

2.10 Apply new dash number "051" using stencil and white ink supplied in kit, and brush or air-operated equipment. Stencil per ND 1002019.

2.11 Re-assemble black protective cover with hardware retained from step 2.5.

2.12 Remount Logic Plate Assembly No. 3 on to support brackets in chassis. Attach cable connectors and secure assembly with hardware retained from step 2.4. Lower plate to its operating position.

2.13 Remove the nameplate from the side of the Programmer & Monitor Drawer Assembly by using a pocket knife being careful not to mar the surface of the assembly. Dispose of name plate per Paragraph IX.

2.14 Remove excess adhesive from assembly using Methyl Ethyl Ketone and cotton swabs.

WARNING:

Methyl Ethyl Ketone gives off toxic fumes and is flammable. Use only in a well-ventilated area and avoid open flames.

2.15 Remove nameplate (1004260-283) from kit. Note serial number on nameplate removed in step 2.13 and stencil the same number in the applicable block on the new nameplate using stencil supplied in kit ("RAY" etc.), black ink, supplied in kit, and brush or air-operated equipment. Stencil per ND 1002019.

2.16 Reference drawing 2014041. Bond new nameplate to the location indicated by the drawing using adhesive (MIL-A-5092) and cotton swabs.

2.17 Release slide lock and return the Programmer & Monitor Drawer Assembly to its operating position. Secure handle hardware.

3. Retrofit the Self Test Drawer Assembly, part number 2014366-031, using retrofit kit 8104215 as follows:

3.1 Release the Self Test Drawer Assembly by unscrewing knurled captive screws and pull the drawer out to its slide-lock position.

3.2 Remove the black protective cover on the Logic Plate Assembly by unscrewing cross-head screws (16 places). Retain cover and screws for reassembly.

3.3 Remove from retrofit kit one 750 pf, 500 V capacitor, part no. CY22C751G, and assemble insulation sleeving (MIL-I-631), also supplied in kit, to the leads of the capacitor.

3.4 Reference drawing 2014362 and add the capacitor to the following locations using solder and soldering tools per ND 1002071.

Capacitor No.	From	To
C22	1A13-20	1A9-8

3.5 Loosen captive hardware (4 places) and pivot Logic Plate Assembly so that stenciling on side is facing up.

3.6 Reference drawing 2014362. Remove stencil "031" from part number on top of frame support using Chem-Stripper and cotton swabs.

3.7 Neutralize action of Chem-Stripper with isopropyl alcohol and cotton swabs. Clean area throughly.

3.8 Apply new dash number "041" using stencil and white ink supplied in kit, and brush or air-operated equipment. Stencil per ND 1002019.

3.9 Return Logic Plate Assemb o its operating position and secure captive hardware (4 places).

3.10 Re-assemble black protectiv cover with hardware retained from step 3.2.

3.11 Remove the nameplate from the side of the Self Test Drawer Assembly using a pocket knife being careful not to mar the surface of the assembly. Dispose of the nameplate per Paragraph IX.

3.12 Remove excess adhesive from assembly using Methyl Ethyl Ketone and cotton swabs.
